

The Plan

A live decision room for friend groups — so "what are we doing tonight" gets answered in minutes, on everyone's screen at once, instead of forty messages deep in a group chat.

example room – friday night plans

"Life with friends runs on coordination nobody enjoys"

Trips, expenses, plans, chores — decided in the group chat, tracked in one person's app, chased by whoever cares most.

Our case: Friday night

Six friends, one group chat. Three restaurant suggestions get buried under forty messages. Two people never say what they actually wanted. Someone just picks something at 8pm, annoyed.

Why it's worth solving

This isn't a once-a-month problem like rent. It happens every time a group tries to agree on anything — weekly, sometimes daily, for any active friend group.

Who's stuck with this today

Friend groups

Deciding casual plans — where to eat, what to watch, weekend plans. The most frequent, most relatable case.

Flatmates

Quick shared-household calls — whose turn, what to order, what to fix first.

Study / project groups

Picking a meeting time, a venue, or a next topic without a 20-message back-and-forth.

Existing tools cover narrow slices of this (bill-splitting, scheduling polls). Nobody owns "quick group decision, live, in the moment."

Same decision, two experiences

STEP	TODAY – GROUP CHAT / DOODLE	WITH THE PLAN
Trigger	"What are we doing tonight?" — into a scrolling thread	Someone opens a Decision Room, adds 2–6 options
Gather input	Replies scatter across 40+ messages; quiet people don't speak up	Everyone taps In / Maybe / Out — live, visible to all
See where the group stands	Nobody knows until someone scrolls back and counts by hand	Live score bars + "3/5 voted," updating the instant anyone acts
Decide	The loudest voice picks something, last minute	Consensus surfaces itself; organizer locks it in when ready
Close it out	Chat keeps scrolling — decision buried, sometimes re-litigated	One confirmed-plan card everyone points back to

HOW WE SOLVE IT

A shared room, not another app to check

No login, no install — a link or QR code opens the room in a browser.

Core mechanic

- Organizer creates a room, adds options
- Anyone can add more, up to a cap of 6
- Everyone votes In / Maybe / Out per option, live
- Score bars update instantly for the whole room
- Lock-in pushes one confirmed card to every device

Use case walk-through

- Priya opens a room: "Dinner?" with 3 options
- Shares the link in the group chat — once
- Five friends vote from their own phones over the next few minutes
- Sushi Place pulls ahead live; Priya locks it in
- Everyone gets the same confirmed card — decision closed

In scope vs. deliberately cut

IN SCOPE

- Create room · title + 2-6 options
- Add options live, up to the cap
- In / Maybe / Out vote per option (score 2 / 1 / 0)
- Live score bars, no refresh
- "X of Y voted" live counter
- Manual or auto lock-in → confirmed plan card
- Join via link / QR, display name only

CUT FOR V1

- Ranked-choice / IRV voting
- Calendar / date-availability merging
- Push notifications
- Accounts, login, auth
- Native mobile app
- Decision history / analytics

Not decoration — load-bearing

CAPABILITY	WHAT IT BUYS US
Reducers as server logic	cast_vote enforces one vote per identity per option atomically — real logic, not a bare insert
Automatic transactional concurrency	Two people voting on the same option at once still resolve to one consistent score — no lost or double-counted vote
Live subscriptions, zero polling	Score bars move on every screen the instant a reducer commits — the actual "wow" moment
Per-connection identity	"3 of 5 voted" and one-vote-per-person, with no login system to build
Built-in persistence	Room / vote state survives without a separate database layer
Unified state + notification layer	Tables, logic, and live push are one system — not five services glued together

Tables, reducers, thin clients

tables

- Room — id, title, status, locked_option_id
- Option — id, room_id, label, added_by
- Vote — room_id, option_id, participant_id, value
- Participant — id, room_id, display_name, identity

reducers

- create_room → new room + options
- add_option → insert, enforce cap of 6
- cast_vote → upsert one row per participant + option

- `lock_decision` → set winner, push confirmed card

Hour by hour

HOURS	WORK	OWNER
0–4	Schema + reducer skeletons: create_room, add_option, cast_vote, lock_decision	Dhanraj
4–10	Vote scoring logic + concurrency test (simultaneous votes, same option)	Dhanraj
4–10	Client UI: room creation, option cards, live score bars, join by code/QR	Nivish
10–16	Wire subscriptions end-to-end, live vote counter, lock-in + confirmed card	Nivish + Dhanraj
16–21	Multi-device testing (5+ simultaneous devices), edge cases, polish	Pranav
21–24	Rehearse with real participants, submit, buffer for bugs	Pranav + all

HOW WE DEMONSTRATE

Judges vote, not watch

The audience becomes the room — proof by experience, not narration.

STEP	WHAT HAPPENS
1	Room live with 4 options loaded, zero votes
2	Hand out the room link / QR to 3-4 judges or teammates
3	Everyone votes live — bars move for the whole room at once, "3/5 voted" ticks up
4	Someone changes their vote — bar re-adjusts live, proving it's reactive
5	Organizer taps "Lock it in" — winning option becomes a confirmed card on every device, same instant

small potato stuff — midnight moonshot team brief, v2
